Renitor

Professional Liquid Calcium

Renitor is a first-class specialty professional liquid Calcium product designed for superior uptake. The unique Ace-X delivery method ensures that Calcium is both delivered in a superior manner to the root-zone and also releases formerly insoluble Calcium from the soil. Renitor is unaffected by cold root temperatures and can lower soil pH over time by burning off bicarbonates.

The Ace-X delivery system is employed to overcome the numerous physiological uptake hurdles soil can pose. Designed for root-zone application, Renitor also helps to ameliorate high sodium levels and subsequently can improve soil structure over time, particularly those of heavy clays. Renitor is also especially useful for high Calcium demanding crops that can suffer from fruit deformities stemming from poor Calcium uptake or for any crops that are planted in overly alkaline or sodic soils.

Rates and Guidelines:

Fertigation: 5 – 10L/ha. Recommended to use with a pre-plant lime application. Renitor will lower soil pH.
